Thermal Efficiency

When sunlight hits a window some of the solar energy is transmitted through (Solar Transmittance T%), some is reflected back (Solar Reflectance R%) and some is absorbed by the glass and sun screen (Solar Absorption A%). Some of the absorbed heat will allow into the building.

Visual Transmittance (T%)

The percentage of total visible solar energy passing through a sun control fabric. The higher the number, the more visible light will penetrate into the interior, the greater the glare.

Visibility

Darker colours have a lower T% value, and a higher A% value, providing better outward visibility.
